

Que_1: Write a Python class to implement pow(x, n).

Code:

```
try:
    while True:
        X = eval(input('Enter the Number: '))
        N = eval(input('Enter the power: '))
        class Power:
            def __init__(self,Num,Pow):
                self.Num = Num
                self.Pow = Pow
            def Expon(self):
                print(self.Num**self.Pow)

        Obj = Power(X,N)
        Obj.Expon()

except exception as e:
    print (e)
```
